

# Assignment 1: Random Variables, Sampling and Estimation

---

October 10, 2018

## 1 PROPERTIES OF RV

1. Suppose a variable  $Y$  is an exact linear function of  $X$ :

$$Y = \lambda + \mu X$$

where  $\lambda$  and  $\mu$  are constants, and suppose that  $Z$  is a third variable. Show that  $\rho_{XZ} = \rho_{YZ}$ .

## 2 CONSISTENCY AND UNBIASEDNESS

1. In the model

$$y_t = \alpha x_t + u_t \tag{2.1}$$

$x_t$  is an explanatory variable which can be regarded as fixed in repeated samples.  $u_t$  is an unobserved disturbance for which it is assumed that

$$E(u_t) = 0, E(u_t u_s) = \begin{cases} 0, & \text{if } s \neq t. \\ \sigma^2, & \text{otherwise.} \end{cases} \tag{2.2}$$

An estimator of  $\alpha$  is  $\frac{1}{T} \sum_{t=1}^T \left\{ \frac{y_t}{x_t} \right\}$ .

Under the assumptions above show that the estimator is unbiased and consistent. Comment briefly on the efficiency of the estimator.

2. Show that, when you have  $n$  observations, the condition that the generalized estimator  $(\lambda_1 X_1 + \dots + \lambda_n X_n)$  should be an unbiased estimator of  $\mu_x$  is  $\lambda_1 + \lambda_2 + \dots + \lambda_n = 1$

### 3 HYPOTHESIS TESTING

1. Before beginning a certain course, 36 students are given an aptitude test. The scores and the course results(pass/fail) are given below:

| student | test score | course result | student | test score | course result | student | test score | course result |
|---------|------------|---------------|---------|------------|---------------|---------|------------|---------------|
| 1       | 30         | fail          | 13      | 26         | fail          | 25      | 9          | fail          |
| 2       | 29         | pass          | 14      | 43         | pass          | 26      | 36         | pass          |
| 3       | 33         | fail          | 15      | 43         | fail          | 27      | 61         | pass          |
| 4       | 62         | pass          | 16      | 68         | pass          | 28      | 79         | fail          |
| 5       | 59         | fail          | 17      | 63         | pass          | 29      | 57         | fail          |
| 6       | 63         | pass          | 18      | 42         | fail          | 30      | 46         | pass          |
| 7       | 80         | pass          | 19      | 51         | fail          | 31      | 70         | fail          |
| 8       | 32         | fail          | 20      | 45         | fail          | 32      | 31         | pass          |
| 9       | 60         | pass          | 21      | 22         | fail          | 33      | 68         | pass          |
| 10      | 76         | pass          | 22      | 30         | pass          | 34      | 62         | pass          |
| 11      | 13         | fail          | 23      | 40         | fail          | 35      | 56         | pass          |
| 12      | 41         | pass          | 24      | 26         | fail          | 36      | 36         | pass          |

Do you think that the aptitude test is useful for selecting students for admission to the course, and if so, how would you determine the pass mark? (Discuss the trade-off between Type I and Type II error associated with the choice of pass mark.)

2. You wish to test  $H_0 : \mu = 0$ . You believe that  $\mu$  cannot be negative and so the alternative hypothesis is  $H_1 : \mu > 0$ . Accordingly, you decide to perform a one-sided test. However, you are wrong.  $\mu$  is actually equal to  $\mu_1$ , and  $\mu_1$  is negative. What are the implications for your test results?
